

FastLearn Platform Guide

FastLearn Platform Guide

Published: 2026-09-04

Platform: <https://fastlearn.fun>

Open-source foundation: [FastLMS](#)

Interface and catalogue languages: English, Estonian, Lithuanian and Spanish

Language-learning targets: English, Spanish, French, German, Italian, Portuguese, Mandarin Chinese, Arabic, Japanese and Hindi

This guide explains how students, teachers and the administrator use FastLearn, including role-based access, learning-time reporting and configurable adaptive learning.

Screenshots were reviewed on 2026-09-04. Learner screens come from the current FastLearn product tour; teacher screens use a controlled documentation account on the same application build. No production learner data is shown.

1. Platform overview

FastLearn provides structured courses, focused lessons, quizzes, visible progress and an AI Tutor. The public product runs at `fastlearn.fun` ; FastLMS remains the open-source implementation and developer-facing reference.

Platform capabilities

- Ten published courses across programming, mathematics, science, language, geography and creative writing.
- Course modules, lessons, quizzes, XP, streaks, badges and a leaderboard.
- An AI Tutor grounded in the lesson being studied.
- English, Estonian, Lithuanian and Spanish interface and course content.
- Native-to-target language practice across ten major languages.
- Google OAuth and password authentication.
- Enforced admin, teacher and student permissions.
- Team invitations and teacher/course assignments.
- Active learning-time measurement.
- Linear and adaptive learning strategies.
- Teacher-reviewed generation for question variants and remedial or extension lessons.

2. Roles and permissions

Capability	Admin	Teacher	Student
Browse all published courses	Yes	Yes	Yes
Learn from any published course	Yes	Yes	Yes
See own progress and active time	Yes	Yes	Yes
Create and edit assigned courses	Yes	Yes	No
Invite students to the platform	Yes	Yes	No
Assign students to a teacher-owned course	Yes	Yes	No
View learners in assigned courses	Yes	Yes	No
Manage all users, roles and courses	Yes	No	No
Change users between teacher and student roles	Yes	No	No

`kaljuvee@gmail.com` is the sole administrator. During signup, a new user chooses **Student** or **Teacher**, and the same choice is carried through password registration or Google SSO. Existing accounts keep their saved role when signing in again. Invitation roles take precedence, and no signup option can create another administrator. The administrator can later move other accounts between student and teacher.

Access principles

- Permissions are checked by the server, not merely by hiding navigation links.
- Teachers manage only courses assigned to them and only see learner records relevant to those courses.
- Teachers may invite a student to the whole platform. The invitation does not restrict the student to one course.
- Students can explore every published course.
- A course assigned by a teacher or administrator displays an **Assigned** tag. Self-selected courses remain available without that tag.
- Role changes, invitations and assignments are written to an audit log.

3. Signing in

Open fastlearn.fun, select **Sign In**, then choose **Create your account**.

The image shows a 'Create your account' form centered on a light gray background. The form has a title 'Create your account' and a subtitle 'I AM SIGNING UP AS'. Below this, it says 'Choose how you plan to use FastLearn.' There are two radio button options: 'Student' (selected) with the description 'Learn and explore courses', and 'Teacher' with 'Teach and manage learners'. Below these is a 'Continue with Google' button with the Google logo. A horizontal line with 'or' in the center separates this from the text input fields. There are three input fields labeled 'DISPLAY NAME', 'EMAIL', and 'PASSWORD'. At the bottom of the form is a green 'Create your account' button and a smaller 'Sign in' link below it.

Students and teachers may use their email and password. Google SSO is available at fastlearn.fun/auth/google; it returns the authenticated user to the FastLearn application. The registered callback is:

```
https://fastlearn.fun/auth/google/callback
```

The original FastLMS callback remains registered separately. Never share a password, OAuth code or recovery token with another user.

On **Create account**, select **Student** to learn and explore courses or **Teacher** to teach and manage learners. The selected role also applies when **Continue with Google** is used from that signup screen. Returning Google users retain their existing database role.

4. Student guide

4.1 Browse the catalogue

Select **Courses** in the left navigation. Course cards show subject, difficulty, description and progress where applicable.

An **Assigned** tag distinguishes a teacher/admin assignment from a course the student chose independently. Assignment is a recommendation or curriculum requirement; it does not hide the rest of the catalogue.

4.2 Open a course and follow its path

Select a course card to see its modules, lessons and overall progress. In the default **linear** strategy, lessons follow the teacher-defined order.

Select a lesson title to begin. A completed indicator appears beside finished lessons, and the progress bar updates as the course advances.

4.3 Study a lesson

Lessons contain explanations, examples, practical material and optional media. The header shows expected duration and XP.

The screenshot displays the FastLearn user interface. On the left is a sidebar with the FastLearn logo, user stats (105 XP Level, 1d Streak), navigation links (Dashboard, Courses, Leaderboard), and an AI Tutor button. The main content area shows the lesson 'What is Python?' under 'Python Fundamentals / Getting Started'. It includes a header with duration and XP, a title, a brief introduction, a section 'Why Learn Python?' with a bulleted list of benefits, a code block for a 'Hello, World!' program, a paragraph about Python's simplicity, a section 'How Python Runs' explaining it's an interpreted language, and a 'Key takeaway' box about developer productivity.

Python Fundamentals / Getting Started

What is Python?

5 min +20 XP Text

What is Python?

Python is a high-level, interpreted programming language created by Guido van Rossum in 1991. It's known for its clean syntax and readability.

Why Learn Python?

- **Beginner-friendly:** Clean syntax that reads like English
- **Versatile:** Web dev, data science, AI/ML, automation, scripting
- **Huge ecosystem:** Over 400,000 packages on PyPI
- **In-demand:** One of the most requested skills in tech

Your First Program

```
print("Hello, World!")
```

That's it! No boilerplate, no ceremony. This is what makes Python special.

How Python Runs

Python is an **interpreted** language. Your code is executed line by line by the Python interpreter, unlike compiled languages (C, Java) that convert everything to machine code first.

Key takeaway: Python prioritises developer productivity over raw execution speed. For most applications, this is the right trade-off.

Use the actions at the end of a lesson to:

1. Mark the lesson complete.
2. Open its quiz, when provided.
3. Ask the AI Tutor for help in the current context.
4. Continue to the next recommended lesson.

4.4 Complete quizzes

Choose one answer for each question and submit the quiz. FastLearn displays the score, pass status, correct answers and explanations.

The screenshot shows the FastLearn interface for a quiz titled "Variables & Types Quiz". The left sidebar contains the FastLearn logo, user progress (105 XP LEVEL, 1d STREAK), navigation links (Dashboard, Courses, Leaderboard), and a button for the AI Tutor. The main content area has a "Back to lesson" link, the quiz title, and a pass threshold of 60% (+30 XP on pass). It displays three questions with multiple-choice options:

Question 1: What is the type of `x = 3.14`?

- ☐ int
- ☐ float
- ☐ str
- ☐ decimal

Question 2: Which data structure uses key-value pairs?

- ☐ list
- ☐ tuple
- ☐ dict
- ☐ set

Question 3: What does `type(True)` return?

Quiz attempts contribute to progress and, in adaptive mode, to the learner's current difficulty and recommendation state. An unsuccessful attempt is evidence for extra support—not a punishment or a permanent label.

4.5 Use the AI Tutor

Open **AI Tutor** from the navigation or from a lesson. When opened from a lesson, the tutor receives the relevant lesson context. Suggested prompts can request a simpler explanation, a practical example or a short knowledge check.

The tutor responds in the selected interface language unless the student asks for another language. Students should not submit passwords, private identifiers or information they are not permitted to share.

4.6 Understand active learning time

FastLearn counts active learning in three contexts:

- reading or interacting with a lesson;
- answering a quiz;
- using the AI Tutor within a course.

The browser sends a heartbeat every 30 seconds. Time pauses immediately when the tab is hidden and after 90 seconds without keyboard, pointer or touch activity. Returning to the page starts a new active interval. This prevents a page left open overnight from being counted as study time.

Students see their total active time on their profile. Teachers see the lesson, quiz and AI Tutor split for their own courses. Historical time from before tracking was enabled cannot be reconstructed reliably.

4.7 Understand adaptive recommendations

Courses remain linear unless a teacher enables **adaptive** mode.

In adaptive mode:

- core lessons remain mandatory;
- prerequisites are always respected;
- optional lessons may be skipped;
- weak performance can insert an easier question set and a remedial lesson;
- sustained strong performance can raise question difficulty and prioritize an extension lesson;
- the student can see why a recommendation changed;
- a teacher can override the recommendation or restore the standard sequence.

The default rules are:

Evidence	Adjustment
Recent accuracy below 60%	Reduce question difficulty by one level and queue relevant remedial material
Accuracy above 85% across two assessments	Increase difficulty by one level and prioritize an extension activity
Accuracy between those thresholds	Keep the current level

FastLearn never changes by more than one difficulty level at a time and falls back to the nearest approved material when an exact match is unavailable.

4.8 Learn another language

Open **Language learning** in the left navigation. Choose the language the student already speaks, the target language and a daily practice goal.

Supported language pairs

The target-language engine currently supports:

- English;
- Spanish;
- French;
- German;
- Italian;
- Portuguese;
- Mandarin Chinese;
- Modern Standard Arabic;
- Japanese;
- Hindi.

Estonian and Lithuanian are also available as native starting languages. This lets a student begin with familiar instructions even when the target language uses another script.

How practice works

Each practice turn follows an audio-first recall loop:

1. Read the meaning in the native language.
2. Anticipate and say the target expression aloud before revealing it.
3. Reveal the target expression and its romanisation where appropriate.
4. Listen to browser-generated pronunciation.
5. Rate recall as **Again**, **Hard** or **Got it**.
6. Let FastLearn schedule the next appearance.

The initial dictionary contains 30 frequency-informed words and functional expressions aligned across every supported language. Difficult expressions return sooner. Successful recall expands from short in-session intervals to hours, days and months. This is a Pimsleur-style use of anticipation and graduated interval recall with original content; FastLearn does not reproduce proprietary Pimsleur lessons or recordings.

5. Teacher guide

5.1 Manage assigned courses

Open **Manage courses** to review course title, subject, difficulty and publication status.

Manage Courses

+ New Course

TITLE	CATEGORY	DIFFICULTY	STATUS
Python Fundamentals	Programming	Beginner	Published
Mathematics Foundations	Mathematics	Beginner	Published
Creative Writing	Creative Writing	Beginner	Draft

This list contains only courses owned by or assigned to the teacher. The administrator retains access to every course.

5.2 Build and publish a course

Open **Course setup**. The authoring flow has five stages:

1. Create or select a course.
2. Add modules.
3. Add lessons.
4. Create quizzes and questions.
5. Review and publish.

The screenshot shows the 'FastLearn' interface for course configuration. On the left is a sidebar with a user profile (860 XP, 6d streak) and navigation links: Dashboard, Courses, Leaderboard, Manage courses, Course setup (highlighted), SCHOOL (Overview, Students, Programmes, Gradebook, Attendance, Fees), AI Tutor, Developers, and Guide Teacher. The main area is titled 'Course Configuration' with the subtitle 'Create and configure courses step by step'. It features a progress bar with five steps: 1. Course (active), 2. Modules, 3. Lessons, 4. Quizzes, and 5. Publish. Below the progress bar, the 'Create or select a course' section lists 'Existing courses' (Python Fundamentals, Mathematics Foundations, Creative Writing) and a 'New course' form. The form includes fields for TITLE (e.g., Introduction to Data Science), CATEGORY (e.g., Computer Science), DIFFICULTY (Beginner), and a DESCRIPTION (A short description of what students will learn...). A 'Create Course' button is at the bottom.

Draft courses remain invisible to students until published. Teachers should preview titles, lesson order, answer options and translations before publication.

5.3 Invite and assign students

Open **Team**, enter the student's email and send an invitation through the existing Postmark service.

- Invitations do not expire.
- Each invitation is single-use and can be revoked.
- Accepting an invitation gives the learner access to the whole platform.
- The teacher may then assign the learner to one of the teacher's courses.
- An administrator may assign any learner to any course.
- Assigned courses display an **Assigned** tag in the learner catalogue.

Teachers cannot change a user's platform role. The administrator can change users between student and teacher roles and can grant teachers access to courses.

5.4 Configure a learning strategy

Open **Manage courses**, then select **Learning strategy** for a course.

The screenshot shows the 'FastLearn' interface for managing courses. The left sidebar contains navigation links: Dashboard, Courses, Leaderboard, Manage courses (highlighted), Course setup, Team, Reports, SCHOOL (Overview, Students, Programmes, Gradebook, Attendance, Fees), AI Tutor, Developers, and user information (Julian Kaljuvee, Sign out). The main content area is titled 'Manage courses' and 'Mathematics Foundations'. Under 'Learning strategy', it states 'Linear keeps the authored order. Adaptive can reorder support and extension material after assessments.' The configuration includes a dropdown for 'Adaptive', input fields for 'SUPPORT BELOW (%)' (60) and 'CHALLENGE AT (%)' (85), checkboxes for 'Reorder learning path' and 'Generate support lessons' (both checked), and a 'Save settings' button. Below this is a 'Generated drafts for approval' section with a dropdown for 'Understanding Variables', a 'Support' dropdown, and a 'Standard' dropdown. A 'Generate EN · ET · LT draft' button is present. Two draft cards are shown: 'Remedial' (Guided practice: Understanding Variables) and 'Quiz Variant' (With the key idea in view, which approach best demonstrates understanding of Understanding Variables?). Both drafts are in 'Pending' status and have 'Approve and publish' and 'Reject' buttons.

Linear preserves the normal module and lesson order. For **Adaptive**, configure:

- low- and high-performance thresholds;
- whether recommendations may reorder the path;
- whether FastLearn should generate support lessons;
- lesson type: `core` , `remedial` or `optional` ;
- question difficulty: easier, standard or harder.

Core lessons determine required course completion. Remedial and optional extension material can be inserted or prioritized according to performance; explicit prerequisites remain ahead of dependent lessons.

5.5 Generate material for approval

A teacher may request generated material for a selected lesson. FastLearn produces:

- easy, standard and challenging question variants;
- answer options, correct answer and explanation;
- remedial lesson drafts for common misconceptions;
- extension lesson drafts for learners ready to move further;
- English, Estonian, Lithuanian and Spanish versions.

Generated material always starts as **Pending**. Before approval, the teacher should verify factual accuracy, difficulty, age appropriateness, wording, translations and that the correct answer appears exactly among the answer options. Only approved variants become lessons or quiz questions.

5.6 Review learner progress and time

Teachers see reporting only for learners in their assigned courses. The administrator sees platform-wide reporting.

Learning reports

Active time pauses when the tab is hidden or the learner is inactive for 90 seconds.

STUDENT	COURSES	PROGRESS	AVERAGE SCORE	DIFFICULTY	ACTIVE TIME	LESSONS	QUIZZES	AI TUTOR
Demo Learner learner@example.test	Mathematics Foundations	0/1	40%	1	1h 5m	45m	7m	13m

Reports include:

- active time by course, split across lessons, quizzes and AI Tutor;
- completed core lessons;
- average quiz score;
- current adaptive difficulty;
- the learner and course associated with each total.

Time is an engagement signal, not proof of understanding. It should be considered alongside assessment evidence and teacher observation.

6. Administrator guide

The administrator uses **Team** to:

- invite students or teachers;
- change student and teacher roles;
- assign teachers to courses;
- assign any student to any course;
- revoke unused invitations;
- view platform-wide learning and time reports.

Role changes take effect on the next authorized request. The server will reject unauthorized direct URLs and form submissions even if a user attempts to bypass the interface.

7. Adaptive-learning decision process

The adaptive engine is deterministic and explainable:

1. Record the student's individual answers and assessment score.
2. Update the learner's course difficulty and consecutive-high-score count.
3. Compare performance with the course thresholds.
4. Move at most one difficulty level.
5. Select the nearest approved question difficulty and keep prerequisites ahead of dependent lessons.
6. Keep all core lessons, insert remedial work after difficulty, or prioritize extension work after sustained success.
7. Store the decision, evidence and rule used.
8. Show the student a plain-language reason and make the decision visible to the teacher.

If no approved material exists at the selected level, FastLearn uses the closest available approved question or returns to the teacher-defined linear path.

8. Language support

Use the flag selector in the navigation to switch between:

- English;
- Eesti;
- Lietuvių;
- Español.

The selected language applies to navigation, course and lesson content, quizzes, answer explanations, AI Tutor prompts and generated drafts. Difficulty changes must never silently switch the learner's language.

The interface language and language-learning pair are independent. For example, a student can use the Spanish interface while learning Mandarin Chinese from English, or use the Estonian interface while learning Spanish from Estonian.

9. Data and audit records

FastLearn retains:

- user role and status;
- invitations and their sender, recipient, use or revocation state;
- teacher/course and student/course assignments;
- active learning sessions and aggregated durations;
- quiz attempts and individual responses;
- adaptive difficulty, recommendations and their assessment evidence;
- generated content versions and teacher approval decisions.
- native and target language preferences, recall ratings and next-due intervals.

Access follows least privilege: students see their own data, teachers see relevant assigned-course data, and administrators see platform-wide records. Passwords and OAuth tokens are never part of learning analytics.

10. Quick reference

Student

1. Sign in and choose a language.
2. Open an assigned course or explore the catalogue.
3. Work through the recommended lesson.
4. Complete its quiz.
5. Use AI Tutor when an explanation is unclear.
6. Review progress, active time and adaptive recommendations.
7. Open **Language learning** to practise a chosen target language from the student's native language.

Teacher

1. Open **Manage courses**.
2. Build content through **Course setup**.
3. Preview and publish the course.
4. Use **Team** to invite students and assign them to teacher-owned courses.
5. Configure linear or adaptive learning.
6. Generate variants, review every draft and approve suitable material.
7. Monitor progress, adaptive difficulty and active time.
